Challenge: New? Start Here!

Category: Miscellaneous

Date: 04/21/26

I. Objective

The objective of this challenge is to locate the hidden flag by exploring unconventional sources, specifically outside the challenge platform itself. Participants are expected to investigate provided hints and utilize external resources to uncover the flag.

II. Background

This challenge introduces players to the concept of **out-of-band (OOB) information gathering**, a common technique in CTF competitions. Instead of solving a puzzle directly on the platform, participants must explore external channels such as Discord servers, social media, or other community spaces.

In this case, the challenge hints that the flag may be found within the official **JerseyCTF Discord server**, encouraging players to analyze chat logs and identify anything unusual or suspicious.

III. Tool Used

- **Discord** – used to navigate the official server and locate the flag within the message logs

IV. Methodology

1. First, ensure that you have joined the official JerseyCTF Discord server.
2. Navigate to the **#welcome-logs** channel.

3. Use the search function (Ctrl + F) and look for the keyword **“jctf.”**

4. Among the results, identify a highlighted message where a user mimics or blends in with bot-generated welcome logs.

5. Upon closer inspection, the message contains the hidden flag.

V. Result

`jctf{beep_boop_i_am_a_flag}`

VI. Explanation

The challenge relies on **social engineering awareness and observation skills** rather than technical exploitation. By searching through the Discord server logs, it becomes evident that a user impersonated or blended in with automated bot messages.

This fake message was crafted to look like a legitimate system log, making it easy to overlook. However, careful inspection reveals that the message contains the flag embedded within it.

Using the search function (Ctrl + F) significantly speeds up the process by filtering messages containing keywords like “jctf,” allowing the participant to quickly identify the suspicious entry.

VII. Conclusion

This challenge demonstrates that not all CTF problems require coding or cryptography—sometimes, **attention to detail and investigative skills** are enough.

It highlights the importance of:

- Exploring all provided resources, including external platforms
- Verifying the authenticity of messages or data
- Using simple tools like search functions effectively

Overall, the challenge serves as a great introduction to real-world scenarios where critical information may be hidden in plain sight.
